How To Order Spare Parts

To assure prompt delivery when ordering parts, please furnish the following information: 1) Complete name and address of consignee. 2) Method of shipment preferred. 3) Is shipment to be prepaid or collect? 4) Serial numbers of units to which parts apply. 5) Complete part numbers and descriptions. 6) Any special instructions.

*Specify unit serial number when ordering parts!*

**Warranty**

E.D. Etnyre & Co. warrants to the original Purchaser, its new product to be free from defects in material and workmanship for a period of twelve (12) months after date of delivery to original Purchaser. The obligation of the Company is limited to repairing or replacing any defective part returned to the Company and will not be responsible for consequential damages or any further loss by reason of such defect.

The company excludes all implied warranties of merchantability and fitness for a particular purpose. There are no warranties, express or implied, which extend beyond the description of the goods contained in this contract.

This warranty does not obligate the Company to bear the cost of machine transportation in connection with the replacement or repair of defective parts, nor does it guarantee repair or replacement of any parts on which unauthorized repairs or alterations have been made or for components not manufactured by the Company except to the extent of the warranty given by the original Manufacturer.

This warranty does not apply to:

1. Normal start-up services, normal maintenance services or adjustments usually performed by the selling dealer, factory service representative or customer personnel.
2. Any product manufactured by E.D. Etnyre & Co. purchased or subjected to rental use.
3. Any product or part thereof which shows improper operation, improper maintenance, abuse, neglect, damage or modification after shipment from factory.
4. Any product or part thereof damaged or lost in shipment. Inspection for damage should be made before acceptance or signing any delivery documents releasing responsibility of the delivering carrier.

This warranty and foregoing obligations are in lieu of all other obligations and liabilities including negligence and all warranties of merchantability or otherwise, express or implied in fact or by law.

E. D. ETNYRE & CO., Oregon, Illinois 61061-9778
1333 South Daysville Road Phone: 815/732-2116 Fax: 815-732-7400
Safety Instructions

Safety warnings have been provided to call attention to any potentially hazardous situation that may cause property damage, personal injury or death to the operator or bystanders. These safety warnings are identified by the following warning symbol.

- The DANGER symbol alerts you to immediate hazards which WILL result in severe personal injury or death.
- The WARNING symbol alerts you to hazards which may cause severe personal injury or death.
- A CAUTION alerts you to procedures that may result in damage to the equipment if not followed properly.
- An IMPORTANT provides general information that the operator should be aware of when performing an operation.

All of these warnings appear throughout the manual. As with any type of equipment, there are certain hazards associated with improper or careless operation. The ability to read and understand the instructions in this manual should be a required qualification to become an operator.

⚠️ HOT SURFACES

Since this tank is intended to store hot liquid asphalt, the surfaces of the tank and equipment may be hot. All surfaces and equipment should be considered to be hot. Wear insulated gloves and protective clothing to prevent burns. The piping is heated with electric heat tape, it will be hot even though it has not been used recently.

⚠️ HOT LIQUIDS

The liquids stored in this tank are hot. The piping and hoses used to transfer the liquids are hot. Wear insulated gloves, protective clothing and a face shield when transferring hot liquids, or handling hot liquid hoses to avoid burns. Stay clear of piping that may contain hot liquids. Leave all valves closed unless you are performing an operation which requires a valve to be opened. Do not open valves unless you are prepared for asphalt to flow.

⚠️ ELECTRICAL SHOCK

This equipment is powered by high voltage electricity. To avoid electrical shock causing personal injury or death, so not attempt to make repairs or adjustments without turning the main power off at the control panel. Do not attempt to operate this equipment with the control panel door open.

⚠️ MOVING PARTS

This equipment contains moving parts, turning shafts, pulleys and belts. Keep all guards in place when operating. The agitator is controlled by a timer and may start unexpectedly. To avoid entanglement, do not attempt to make repairs or adjustments without turning the main power off at the control panel.

⚠️ FALLS

To avoid falls that could result in death or serious injury, do not climb over the guard rails on to top of the tank for any reason. Be careful when working on top of the tank to avoid dropping tools or parts that could strike someone on the ground.

Insulation
The tank is covered with fiberglass insulation, four inches thick. The insulation is intended to maintain the temperature of the heated asphalt. The insulation is covered with .040 Min. aluminum sheeting for weather protection.

Electric Heaters
The tank is heated with a 28KW Unitized Heater. The heater is located inside the bottom of the tank, it is controlled by a thermostat located in the control box. A light in the control box door indicates when the heater is on.

Float Guage
The tank is equipped with a float type level gauge. A float is hung from a cable passing through the top of the tank. The cable runs over two pulleys and down the side of the tank to an indicator weight. The white line on the indicator weight aligns the tank.

Agitator
The tank is equipped with an agitator to mix the contents of the tank. The agitator is a propeller, supported on a vertical shaft inside the tank. The propeller shaft is supported by a bushing at the bottom and a ball bearing at the top. The agitator is driven by a 7.5 horse power, 240/480 volt motor. This motor is located at the top of the tank. The motor drives the agitator through a belt drive to reduce the speed. The agitator is controlled by an electronic timer, located in the control box.

⚠️ WARNING
The agitator is controlled by a timer and may start unexpectedly. Stay Clear.

Electric Power
Tanks with pumps require 240/480 volt, three phase power, with four wire (neutral wire) system. Conversion to other voltages is done with wiring inside the control box.

⚠️ WARNING
This equipment is powered by high voltage electricity. Turn main power off at control panel before making repairs or adjustments.
Control Box

The control box is located on the side opposite the ladder. In the door of the control box is a master disconnect or switch which controls power for all of the electrical functions. A heater indicator light is also located in the door, indicating when the heaters are on. A pump, forward, off, and reverse switch will be located in the control box door as well. Inside the box are the various fuses and contactors to operate the electrical equipment. A timer for the agitator and the thermostat for the heaters are located inside the control box. Also located inside the control box is a 115 volt receptacle (GFI), that may be used for powering lights or hand tools up to 15 amp capacity.

![Storage Tank Control Panel](image)

**Storage Tank Control Panel**

*Outside View*

---

**DANGER**

This equipment is powered by high voltage electricity.
1. GFCI/Heat Trace Transformer
2. Control Power Transformer
3. ICE Relay
4. Sectional Terminal Block (3-sections)
5. Main Tank Temperature Control
6. Tank High Limit Temperature Control
7. Heat Trace Contactor
8. Agitator Protection Thermostat
9. Heat Trace Fuse Block
10. Reversing Motor Start-up Pump
11. Motor Starter - Agitator
12. Motor Protection Reversing Starter
13. Motor Protection - Agitator
14. Tank Heater Fuse Blocks
15. Tank Heater Contactors
16. GFCI Receptacle
17. Heat Trace Temperature Control
18. Agitator Time Clock
Thermometer

A dial thermometer is located in a dry well in the side of the tank. The thermometer indicates the temperature of the asphalt in the tank. The thermometer may be removed from the well with asphalt in the tank.

![WARNING]

All surfaces and equipment should be considered to be hot. Wear insulated gloves and protective clothing to prevent burns.

Plumbing

Three inch diameter lines run from the bottom of the tank to the pump. The pump is belt driven by a five horsepower 240/480 volt three phase electric motor. It may be used to pump out of the storage tank into other small tanks, or used to pump into the storage tank from transport tanks. The system may also be used to recirculate the product in the storage tank. All lines are insulated and heated with 115 volt heat tape.
Preparation For Use

Inspection

Unpack the ladder, ladder cage and handrail. Check for damage that may have occurred during shipment. Visually inspect the tank, particularly the tank jacket and insulation for damage that may have occurred during shipment. Report any damage to the driver delivering the tank.

Setting Tank In Place

CAUTION Do not stand the storage tank upright without being prepared to weld the legs immediately. High winds can overturn a tank which has not been properly anchored.

1. The tank level gauge float has been secured to the roof of the tank for shipment. Free the float from the roof before lifting the tank to the upright position. Slide the float down the guide cable to the bottom of the tank.

2. All nine tank legs must be fully welded to steel foundation pads, with at least 1/4 inch fillet welds, all the way around each leg. Foundation pads must be securely anchored to the concrete foundation.

3. Install ladder, ladder cage, handrails and platform. Securely tighten all fasteners.

WARNING

To avoid falls that could result in death or serious injury, do not climb over the guard rails on top of the tank for any reason.

WARNING

Keep all guards in place when operating.
Connecting Power

⚠️ DANGER

This equipment is powered by high voltage electricity.

240 volt three phase power is required for A1083 thru A1089 and 480 volt three phase power is required for A1090, with a neutral wire. Power connection and wiring should be done by a qualified electrician to conform to local and national electric codes.

Start Up Rotating Devices

Turn the agitator on and observe the rotation of the shaft and propeller inside the tank. The direction should match the diagram below. If it does not, corrections to the wiring must be made. Turn the pump to forward momentarily and observe the direction of rotation of the pulleys. The direction should match the diagram below. If it does not, corrections to the wiring must be made.

⚠️ WARNING

The agitator is controlled by a timer and may start unexpectedly. Stay Clear.

⚠️ IMPORTANT

When filling the storage tank for the first time, carefully fill until the material level raises to the top of the manhole collar. This will cost the interior of the tank with a thin film of asphalt that will deter corrosion.

⚠️ WARNING

Keep all guards in place when operating.

⚠️ WARNING

To avoid falls that could result in death or serious injury, do not climb over the guard rails on top of the tank for any reason.
Pump Tank Operating Instructions

Heater Operation
1. Do not operate the heaters unless there is at least 700 gallons of asphalt in the tank.
2. Turn the master power switch off and open the control box door.
3. Set the desired temperature on the thermostat knob.
4. Close the control box door and turn the Master Power switch on.
5. The heaters will turn on and off automatically to maintain the set temperature.
6. The indicator light on the control box door will turn on whenever the heaters are on.

Agitator Operation
1. Do not run the agitator when the tank is empty. The lower bearing is lubricated by the asphalt. Running the agitator without asphalt may cause damage to the bearing and shaft.
2. Do not run the agitator when there is less than 1,700 gallons of asphalt. Less than this amount will expose the propeller blades and cause splashing of the asphalt. Splashing of asphalt emulsions may cause them to separate.
3. The agitator may be run continuously by turning it on with a switch on the timer, or set to turn on and off at certain times of the day and days of the week by programming the timer. The Master Power switch on the door of the control box must be on to run the agitator.
4. The agitator thermostat must be set 30° lower than the actual storage temperature of the asphalt.

Unloading Storage Tank with Storage Tank Pump

1. Connect the transport’s hose to the outlet line on the transport tanker.
2. Connect the hose from the transport tanker to the 3 inch fill line on the storage tank. Be sure Fill Line Valve is closed.
3. Open the Valve on the storage tank and on the transport tanker.
4. Start the pump on storage tank.
5. Watch the tank level gauge on the storage tank to protect against over filling the storage tank.
6. Close the valve on the transport tanker.
7. Clean the hoses as directed by the transport tanker operating instructions.
8. Close Valve on storage tank.
9. Shut off pump.
10. Disconnect the hose from the storage tank and install cap.

⚠️ WARNING
All surfaces and equipment should be considered to be hot. Wear insulated gloves and protective clothing to prevent burns.

⚠️ WARNING
The liquids stored in this tank are hot. Wear gloves and protective clothing when transferring or handling hoses.

⚠️ WARNING
Do not open valves unless you are prepared for asphalt to flow. The liquids stored in this tank are hot.
Unloading Storage Tank with Storage Tank Pump
Into Asphalt Distributors or Kettles

1. Connect the hose to the discharge pipe on the storage tank pump.
2. Connect the other end to the distributor or kettle being loaded.
3. Open the valve between the storage tank and the pump on the storage tank.
4. Open the valve between pump and the hose.
5. Open the valve on the distributor or kettle being loaded if there is one.
6. Turn the pump switch forward.
7. Before the distributor or kettle is completely full, close the valve on the storage tank.
8. Shut off pump.
9. If there is a valve on the distributor or kettle, close it.
10. If you are loading the distributor or kettle through a top opening, raise the end of the hose above the level of the liquid in the distributor or kettle.
11. Open the valve between the storage tank and the pump.
12. Turn the pump switch to reverse, and draw the material from the hose and pump it back into the storage tank to clean the hose.
13. If the hose is connected to piping on the distributor or kettle, crack open the hose connection or open the breather vent valve on the distributor or kettle if there is one. This will allow air to flow through the hose to clean it.
14. Disconnect the hose from the distributor or kettle and raise the end so that any asphalt remaining in the hose can drain back to the pump.
15. Once the hose is clean, close the valve between the storage tank and the pump.
16. Shut off pump.
17. Close the valve between the pump and the hose.

**WARNING**

All surfaces and equipment should be considered to be hot. Wear insulated gloves and protective clothing to prevent burns.

**WARNING**

The liquids stored in this tank are hot. Wear gloves and protective clothing when transferring or handling hoses.

**WARNING**

Do not open valves unless you are prepared for asphalt to flow. The liquids stored in this tank are hot.
Cleaning Asphalt Pump

1. With the 3" unloading hose connected to the pump discharge pipe, put the loose end of the hose in a bucket.
2. Check the area for sources of flame, lit cigarettes, torches or lighters. Extinguish all sources of flame.
3. Put the end of the small (3/8"") hose which is attached to the breather vent valve in a bucket of diesel fuel or kerosene.
4. Open the breather vent valve between the pump and the hose.
5. Hold both hoses to avoid being splashed.
6. While holding the hoses securely, turn the pump switch to forward momentarily. This will draw the solvent from the diesel fuel bucket, pump it through the pump and out into the catch bucket.
7. Shut pump off.
8. Drain the remaining solvent from the three inch hose into the catch bucket.
9. Close the breather vent valve between the pump and the 3/8" hose.

**WARNING**

All surfaces and equipment should be considered to be hot. Wear insulated gloves and protective clothing to prevent burns.

**WARNING**

Extinguish all sources of flame, lit cigarettes, torches or lighters.

**WARNING**

Do not open valves unless you are prepared for asphalt to flow. The liquids stored in this tank are hot.
Recirculation

1. Check that the caps are on and locked on the fill and discharge lines.

2. Close the valve at the end of discharge line.

3. Open the valve in the fill line between the tank and pump.

4. Open the valve in the discharge line between the tank and pump.

5. Start pump.

---

**WARNING**

All surfaces and equipment should be considered to be hot. Wear insulated gloves and protective clothing to prevent burns.

---

**WARNING**

Extinguish all sources of flame, lit cigarettes, torches or lighters.

---

PIPING and PUMP

---

**WARNING**

Do not open valves unless you are prepared for asphalt to flow. The liquids stored in this tank are hot.

Appendix I

Remote Bulb Temperature Control
55 Series
Remote Bulb Temperature
Controllers

Please read all instructional literature carefully and thoroughly before starting. Refer to the final page for the listing of Recommended Practices, Liabilities and Warranties.

GENERAL

Temperature variations sensed by the liquid-filled bulb are hydraulically transmitted through the capillary to a stainless steel diaphragm capsule. The capsule operates a lever to actuate one or two snap-action switches.

Part I - Installation

Tools Needed

Drill with #25 (.1495) and 5/16" bits
Flatblade screwdriver

Locate the control where shock, vibration and ambient temperature fluctuations are minimal.

The control can be mounted in any position.

Panel Mounting (Types E55S and E55AS)

Drill panel to accommodate #6-32 screws (2 each). Hole locations should align with tapped holes in mounting bracket (see figure below). Also, drill 5/16" diameter hole to accommodate control adjustment shaft. Note: maximum panel thickness is 1/2 inch.

Surface Mounting (Types E55 and E55A)

Mount using two enclosure mounting holes as shown.

Fully immerse the bulb and 6" capillary in the control zone. For best results it is generally desirable to place the bulb close to (but not touching) the heating or cooling source in order to sense temperature fluctuations quickly. Place the remaining capillary adjacent to the control head so that it will sense the same ambient temperatures. Factory calibration, unless specified otherwise, allows for 6" capillary tube in the sensed medium. If more than 6" will be immersed in the media, recalibration may be necessary, in which case follow procedures outlined in Part II.

"C" style bulbs (1/8" OD) can be coiled or shaped to fit the installation. Avoid sharp bends and coils smaller than 2" radius. Do not bend "B" style bulbs (3/8" OD). Avoid bending or coiling the capillary tube smaller than 1/2" radius. Exercise caution when making bends near the capillary ends. If a separable well or union connector is used follow separate instructions included.

Making Wiring Connections

Wire directly to switch terminals according to particular requirements of the application. For dual switch Types E55A and E55AS, if switches are to be set apart, connect wiring so that switch No. 2 will function at the higher temperature.

All live supply circuits must be disconnected before wiring the control. Wire in accordance with
NATIONAL AND LOCAL WIRING CODES. MAXIMUM RECOMMENDED WIRE SIZE IS #14 AWG.

Switch Settings
On dual switch units, both switches are factory set to actuate together within 5% of range (switch No. 2 set on dial) but may be set to actuate up to 100% of scale range apart. Either switch may be set to agree with the dial. See Part II-Adjustments.

Start-Up Process
Turn dial and knob to the desired temperature setting. Controller is ready for operation. Minor adjustments may be necessary to obtain better set point accuracy after installing the unit in a particular process. See Part II-Adjustments.

Part II - Adjustments

Tools Needed
1/16" Allen wrench
Small screwdriver

WARNING: IF THE UNIT IS BEING USED TO CONTROL A PROCESS, PERFORM CALIBRATION TEST AFTER ADJUSTMENT. UNIT MUST REPEAT ON SUCCESSIVE ON-OFF CYCLES.

Calibration Bath
Place the sensing bulb and the amount of capillary to be exposed to process temperature into the bath, preferably circulating liquid. Bath temperature should be where the greatest setting accuracy is desired or approximately mid-range.

Test Thermometer
Use an accurate test thermometer (such as a thermocouple) with its sensing area located next to the sensing bulb.

Stabilization
Before making adjustments allow 5 minutes for the thermal system to adjust to the bath temperature.

Set Point Reference
Connect test lights to the terminals to indicate switch operation.

Adjusting Single Switch Types E55 and E55S
Set point adjustment is made by rotating the knob and dial to the desired temperature setting. Controls are factory calibrated, and do not normally require recalibration in the field. However, should this become necessary, follow the recalibration procedure.

Adjusting Dual Switch Types E55A and E55AS
55 Series controllers are standardly supplied with the No. 2 (higher temperature) switch set to the dial. To adjust switch settings for these controllers, follow the recalibration procedure.

Recalibration Procedure
Set the dial to the same temperature as the test bath. Using 1/16" allen head wrench, loosen knob set screw and remove dial, taking care not to rotate the shaft.

Shaft has calibrated flat for easy dial replacement. Using 1/16" allen wrench, turn zero adjustment, located inside adjustment shaft, until switch No. 2 actuates. Turn counter clockwise for higher setting, clockwise for lower setting.

Replace dial on shaft. Do not secure. Turn dial to a higher setting equal to temperature differential (°F or °C) desired between switches No. 1 and No. 2. Remove dial for access to the No. 1 switch adjustment screw. Using a small screwdriver turn in or out the No. 1 switch adjustment screw (accessible through opening behind dial). Replace dial, tighten dial set screw to calibrated flat. Controller is ready for operation.

For single switch units the only adjustment needed is the set screw adjustment in the middle of the adjacent shaft.

Part III - Replacements

Tools Needed
1/16" Allen wrench
Small screwdriver

WARNING: DISCONNECT ELECTRICAL SUPPLY SO THAT SWITCH CONTACTS AND TERMINALS ARE NOT ALIVE. REPLACE WITH IDENTICAL SWITCHES ONLY.

Enclosed Types
Remove cover and adjustment dial; then remove two (2) flat head screws to dismount control body from enclosure. Remove the large rectangular cover plate and rubber gasket from the bottom of the enclosure, and disconnect wiring from the switch terminals. Insert the new switch(es) and tighten screws. Recalibrate set-
Recomended Practices

United Electric Controls Company recommends careful consideration of the following factors when specifying and installing UE pressure and temperature units. Before installing a unit, the Installation and Maintenance Instructions provided with unit must be read and understood.

- To avoid damaging unit, proof pressure and max. temperature limits stated in literature and on nameplates must never be exceeded, even by surges in the system. Operation of the unit up to proof pressure or max. temperature is acceptable on a limited basis (i.e. start-up, testing) but continuous operation must be restricted to the designated adjustable range. Excessive cycling at proof pressure or maximum temperature limits could reduce sensor life.

- A back-up unit is necessary for applications where damage to a primary unit could endanger life, limb or property. A high or low limit switch is necessary for applications where dangerous runaway condition could result.

- The adjustable range must be selected so that incorrect, inadvertent or malicious setting at any range point can not result in an unsafe system condition.

- Install unit where shock, vibration and ambient temperature fluctuations will not damage unit or affect operation. Orient unit so that moisture does not enter the enclosure via the electrical connection.

- Unit must not be altered or modified after shipment. Consult UE if modification is necessary.

- Monitor operation to observe warning signs of possible damage to unit, such as drift in set point. Check unit immediately.

- Preventative maintenance/periodic testing is necessary for critical applications where damage could endanger property/personnel.

- For all applications, a factory set unit should be tested before use. Electrical ratings stated in literature and on nameplates must not be exceeded. Overloading a switch can cause damage, possibly on the first cycle. Wire unit according to local and national electrical codes, using wire size recommended in installation sheet.

- Use only factory authorized replacement parts and procedures.

- Do not mount unit in ambient temp. exceeding published limits.

- For remote mounted temperature units, capillary lengths beyond 10 feet can increase chance of error, and may require re-calibration of set point and indication.

Limit Warranty

UE warrants that the product thereby purchased is, upon delivery, free from defects in material and workmanship and that any such product which is found to be defective in such workmanship or material will be repaired or replaced by UE (F.O.B. UE), provided, however, that this warranty applies only to equipment found to be so defective within a period of 12 months after installation by buyer but not to exceed 18 months after delivery by the seller. Except for the limited warranty of repair and replacement stated above, UE disclaims all warranties whatsoever with respect to the product, including all implied warranties of merchantability or fitness for any particular purpose.

Liability Limitation

The sole and exclusive remedy of buyer for any liability or seller for any claim, including incurred in connection with (I) breach of any warranty whatsoever expressed or implied, (II) a negligent act or acts (or negligent failure to act) committed by seller, or (IV) an act for which such liability will be imputed to seller, is limited to the limited warranty or repair and replacement stated herein. In no event shall the seller be liable for any special, indirect, consequential or other damages or like general nature, including, without limitation, losses of profits or production, or loss or expenses of any nature, incurred by the buyer or any third party.

Temperature Control Fenwal
SERIES 400

INDICATING TEMPERATURE CONTROLLER

INSTALLATION INSTRUCTIONS

PRINCIPLE OF OPERATION
Control action of these mechanical indicating temperature controllers is provided through the principle of liquid volume change. See Figure 1. With a change in temperature, the liquid in the sensing bulb expands and contracts, causing the bellows to actuate the switching mechanism. Ambient compensation is provided by an expandable push rod assembly mounted on top of the lever arm which moves the pointer and switching mechanism. Changes in ambient temperatures through a range of 0 to 150°F (-18 to +65°C) expand or contract this push rod assembly to provide an operating balance for the expansion and contraction of the bellows assembly within the actuator housing.

PROCESS DIFFERENTIAL
The process differential is minimum when the narrow differential switch is used; when the fastest responding (smallest diameter) bulb is used, when the narrowest scale range is used, and when the sensing bulb is installed in a suitably designed process and in a location which is close enough to the heater or cooling device to sense temperature changes quickly.

In general, it is difficult to predict the operating differential of a given process. The differential can either be increased or decreased within limits by changing one or more of the variables previously mentioned. An easy way to achieve this is to change the snapswitch since the the snapswitches are all mechanically interchangeable.

SPECIFICATIONS
HOUSING
The housing (and cover assembly) is made of die cast aluminum with a gray baked enamel finish. It is designed to meet the requirements of NEMA Type 4 and 12 (IEC IP65 and IP62). Neoprene or cork neoprene gaskets seal all ports and covers. Even though the housing is watertight, a separate cover or shield is recommended to protect the controller from exposure in outdoor applications.

SNAPSWITCH ELECTRICAL RATINGS
Standard Differential
15 A. 125-250 VAC
0.50 A. 125 VDC
0.25 A. 250 VDC

Narrow Differential: 15 A. 125-250 VAC
Dielectric Strength: Not less than 1500 VDC or 1500 RMS-AC for one minute between the case and terminals connected in parallel

BULB AND CAPILLARY
Material: Type 316 Stainless Steel bulb and capillary are standard. Copper capillary is available upon request.
SERIES 400

SPECIFICATIONS Continued

Temperature Exposure Limits
- 175°F (-115°C) minimum for instruments with a top range limit of up to and including 200°F (100°C)
- 100°F (-15°C) minimum for instruments with a top range limit of 300 through 500°F (150 through 260°C)
- 25°F (5°C) minimum for instruments with a top range limit of 700°F (370°C)
- Maximum temperature is 25°F (15°C) above the top range limit

Pressure Exposure Limit: Bulb will withstand 400 psi (2.75 MPa) over any temperature range

INSTALLATION

CONTROLLER LOCATION
The Series 400 Controller housing (including the controller mechanism and actuator assembly) should be mounted where the ambient temperature is within the limits of -65 and +150°F (-55 and +65°C). The controller is ambient temperature compensated from 0 to 150°F (-18 to +65°C). The controller has high resistance to vibration. However, avoid mounting the unit in areas of extreme vibration if possible. If it is necessary to mount the controller in such a location, use a snapswitch with a maximum acceptable operating differential.

CONTROLLER MOUNTING
The controller can be surface mounted by using the three adjustable mounting brackets attached to the case sides and bottom. Fasten with #10 hardware. Series 400 Controllers (except those with Modification 110. Explosion-proof Housing) can also be panel mounted. The panel cutout should be 6.500 in (165.10 mm) wide by 6.625 in (168.28 mm) high. Four mounting holes are provided in the overhanging portion at the top and bottom of the case. The holes will accept #8 hardware and will be hidden by the cover. A template for the cutout and holes is located on Page 7.

BULB INSTALLATION
Temperature limitations for the bulb and capillary are listed in the SPECIFICATIONS section. For optimum control, the bulb and 6 in (15 cm) of capillary should be immersed in the process.

WARNING
In controllers with upper range limits at 700°F (370°C), plunging the bulb from a very cold temperature into a hot process could cause the bulb to stretch or even rupture, since the fluid is very viscous at temperatures below 25°F (-4°C).

CAUTION
Do not expose bulb to pressures greater than 400 psi (2.75 MPa). Beyond this point, some creep in the bulb structure occurs which introduces offset into the system.

CAPILLARY INSTALLATION
1. Minimum bending radius is 1/4 inch (6 mm).
2. Do not bend capillary closer than 1/4 inch (6 mm) to the bulb-capillary weld.

3. Do not bend capillary closer than 1 1/4 inch (32 mm) to the actuator assembly. However, the capillary may be rotated 360° at the actuator assembly.
4. Where necessary, allow sufficient length to provide strain relief loops in the capillary.
5. Mount bulb and capillary so as to avoid flexing due to vibration.

WIRING

WARNING
High voltages may be present in the controller that could cause severe injury or death. Wiring should only be performed by qualified personnel. Turn off power before wiring. Wire in accordance with local codes.

Wiring Entrance
Entrance for wiring is provided by a knockout on each side of the housing. Remove knockout by applying one or two sharp blows with a metal or wooden dowel. Be careful not to damage switches.

To maintain the watertight and dusttight feature of the Series 400 Controller, proper conduit connector fittings should be used.

In controllers with Explosion-proof Housing (Modification 110), a separate housing for the snapswitches and wiring is located on top of the controller. To maintain the explosion-proof feature of the housing (Class I, Groups C and D, or Class II, Groups E, F, and G, Division 1 or 2), wiring must enter the housing through a pipe that is screwed into the 1/2 NPT port on the side of the housing. For additional moisture proofing, use a waterproof compound on the pipe threads. To gain access to the snapswitches in the housing, remove the front and front panel of the controller to expose the four screws on the front of the housing. Remove these screws and the housing cover.

Wiring Connections
See Figures 2A and 2B for examples of wiring single and dual switch units, respectively. Connections should be made with generous loops of wire so as not to impair switch operation or adjustment. Terminals are marked NO (open below set point), C (common), and NC (closed below set point). Avoid excessive force on snapswitch when making connections.

Controllers with additional snapswitches in the lower compartment (S.F. 75) have prewired and marked connections as follows:

<table>
<thead>
<tr>
<th>Switch Number</th>
<th>Closed Circuit Above Setting Between Wires</th>
<th>Closed Circuit Below Setting Between Wires</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

Note: Switch 1 is nearest front of controller.
ADJUSTMENTS

**KNOB TORQUE ADJUSTMENT**
Knob torque is adjustable by means of the set screw A in the front shaft bearing. See Figure 3, 4, 5, or 6.

**SWITCH ADJUSTMENTS**

⚠️ **WARNING**
Disconnect power when adjusting snapswitches to avoid possible electric shock.

**Model 40-702 (See Figure 3)**
When the set pointer is in exact alignment with the temperature indicating pointer, the switch should be midway between the Operate and Reset positions. The Operate position is the point where the switch clicks on; the Reset position is the point where the switch clicks off. The relationship will usually be upset if the snapswitch is replaced, but it can be easily restored as follows:

1. Remove top cover.
2. Bring set pointer (B) in alignment with indicating pointer (C).
3. Adjust screw (E) midway between the two positions where switch (F) clicks.
4. Check the setting by placing a screwdriver under lever (D) and simulate temperature changes by moving the lever.
5. If necessary, trim the setting by slight adjustment of screw (E).

**Model 40-703 (See Figure 4)**
This controller has two switches, either one of which can be adjusted to operate when the pointers are in alignment. The other switch will either be above or below the indicated setting depending on whether it is used for overheat alarm, warm-up heat, or some other auxiliary function. The procedures are as follows:

A. When the upper setting is indicated by the set pointer:
1. Remove top cover.
2. Bring set pointer (B) in alignment with indicating pointer (C).
3. Adjust screw (H) on the front switch to a point midway between the two positions where switch (I) clicks. This switch must always be the upper of the two settings. An attempt to do otherwise will cause the reset switch to be inoperative.

B. When the lower setting is indicated by the set pointer:
1. Remove top cover.
2. Adjust set pointer (B) the differential amount lower than the indicating pointer (C).
3. Adjust screw (H) on the front switch to a point midway between the two positions where switch (I) clicks.
ADJUSTMENTS Continued

4. Bring set pointer (B) in alignment with indicating pointer (C).
5. Adjust screw (L) on the rear switch to a point midway between the two positions where switch (K) clicks.

For Wider Differentials (Up to 1/2 Scale Length)

1. Remove front cover, top cover, and temperature scale.
2. Adjust screws (H) and (L) to achieve 1/8 in (3 mm) between switch bracket and case shelf.
3. Turn set pointer (B) to extreme left.
4. Raise lever (F) with a screwdriver to move indicating pointer (C) to mid-scale.
5. Turn wide differential screw (G) so that rear switch just actuates.
6. Turn screw (G) counter-clockwise amount shown in Table 1.

Table 1

<table>
<thead>
<tr>
<th>Differential</th>
<th>Screw Turns</th>
</tr>
</thead>
<tbody>
<tr>
<td>3-15%</td>
<td>1/2</td>
</tr>
<tr>
<td>12-23%</td>
<td>1</td>
</tr>
<tr>
<td>23-41%</td>
<td>2</td>
</tr>
<tr>
<td>41-52%</td>
<td>2 1/2</td>
</tr>
</tbody>
</table>

Example: 125°F differential in an instrument with 50-700°F scale is approximately 20% of scale length, since (125/650)(100%) = approximately 19%. Therefore turn screw 1 turn.

7. Replace temperature scale.
8. Align set pointer (B) with indicating pointer (C).
9. Determine which switch is to be indicated.
10. Loosen set screw (P) and rotate pulley on shaft until the switch to be indicated just actuates. Tighten set screw.
11. Check settings by simulating temperature changes with the screwdriver under lever (F). Trim by adjustments to screws (H) and (L).

Model 40-704 (See Figure 5)
When set pointer (B) is in exact alignment with temperature indicating pointer (C), the REAR switch should be midway between the Operate and Reset positions. When set pointer (J) is in exact alignment with temperature indicating pointer (C), the FRONT switch should be midway between the Operate and Reset positions. The Operate position is the point where the switch clicks on; the Reset position is the point where the switch clicks off. The relationship will usually be upset if the snapswitch is replaced, but is easily restored as follows:

1. Remove top cover.
2. Bring set pointer (B or J) in alignment with indicating pointer (C).

3. Adjust screws (E) midway between the two positions where each switch clicks.
4. Check the setting by placing a screwdriver under lever (D) and simulate temperature changes by moving the lever.
5. If necessary, trim the setting by slight adjustment of screws (E).

Explosion-proof Housing (See Figure 6)

When the set pointer (B) is in exact alignment with indicating pointer (C), switch (J) should be midway between the Operate and Reset positions. The Operate position is the point where the switch clicks on; the Reset positions is the point where the switch clicks off. This relationship will usually be upset if the snapswitch is replaced, but is easily restored as follows:

1. Remove knob, front cover, and dial. Use care in removing dial, so as not to deform pointers.
2. Bring the set pointer (B) into alignment with indicating pointer (C).
3. Adjust hex head screw (D) to a position midway between the two positions where the switch clicks.
4. Check the setting by placing a screwdriver under lever (F) and simulating temperature changes by movement of this lever.
5. If necessary, trim the setting by slight readjustment of screw (D).
**ADJUSTMENTS** Continued

Method 2 (For maximum: calibration accuracy over the full temperature range)
1. With the process temperature (or calibration bath) near the center of the scale range, loosen locknut (D).
2. Adjust nut (E) until the indicating pointer agrees with the process temperature.
3. Tighten locknut (D).
4. With the process temperature (or calibration bath) near one end of the scale range, loosen screws (A) and (B) and move the actuator assembly left or right until the indicating pointer agrees with the process temperature.
5. Repeat steps 1 - 3.

**MAINTENANCE**

**LUBRICATION**
No lubrication is required.

**GLASS REPLACEMENT**
1. Remove broken glass and excess cement.
2. Line window frame with Dow Corning 732 RTV Rubber Cement.
3. Insert glass and apply light even pressure.
4. Allow cement to cure before subjecting controller to vibration or shock.

**SNAPSWITCH REPLACEMENT**
Snapswitches are unlikely to need replacement except when operated in a short circuit or continuously in a contaminated atmosphere. The procedures for replacing snapswitches are as follows:

**In Standard Housing (See Figure 8)**
1. Remove top cover.
2. Remove switch and mounting bracket by removing screw (A) and sliding switch to the right (away from screw (B)).
3. If the switch will not easily slide away from screw (B), reduce compression on the switch by depressing lever (F) in Figure 4.
4. Insert new switch. Ensure that insulation remains intact and in position.

---

**Figure 6**

**CALIBRATION** (See Figure 7)
Every Series 400 Controller is carefully calibrated and tested before shipment, but recalibration may be required to nullify offsets resulting from differences between bench calibration and actual process measurement.

**Figure 7**

The entire actuator assembly (C) can be moved to the right or left to increase or decrease, respectively, the rate of travel of the indicating pointer. This is done by loosening screws (A) and (B). Adjustment of nut (E), after loosening locknut (D), raises or lowers the entire bellows by a fixed amount.

To calibrate the controller, use one of the following methods:

**Method 1** (When the controller is normally used within a narrow range of temperatures)
1. With the process (or calibration bath) at the desired temperature, loosen locknut (D).
2. Adjust nut (E) until the indicating pointer agrees with the process temperature.
3. Tighten locknut (D).

---

**Figure 8**

---
MAINTENANCE Continued

In Explosion-proof Housing (See Figure 6)
1. Remove knob and front cover to expose screws (G).
2. Remove four screws (G).
3. Remove two screws (H), switch, and mounting bracket.
4. Insert new switch. Ensure that insulation remains intact and in position.

ACTUATOR ASSEMBLY REPLACEMENT

In the event that the liquid filled assembly has been damaged, it is necessary to replace the entire actuator assembly. See Figure 7.
1. Remove old assembly by removing screws (A) and (B).
2. Install new assembly. Tag on replacement assembly shows proper positioning to provide 1% accuracy. Position groove on actuator housing in relation to scale on housing as indicated on tag.

Note: if the original actuator assembly has a bulb larger than 0.375 in (9.53 mm), e.g., a “C” style (coiled) bulb, it is necessary to specify a packing gland (if required) when reordering the actuator assembly.

Unitized Heater Kit
Unitized Heater Kit
Installation and Operation

Every Process Heating Company (PHCo) product is efficient, safe and reliable. If properly installed and maintained PHCo products will give you many years of dependable service. Should your heater be damaged when received, file a claim with the carrier immediately.

WARNING!!!!!!!  DANGER!!!!!!!

1. Read and understand all tags and installation and operating instructions before commencing.

2. Welding area on tank should be thoroughly cleaned.

3. Work area should be well ventilated.

4. Check that the electrical service will handle the load. Unit must be adequately grounded.

5. All wiring should conform to requirements of national and local electrical codes and or standards.

   Only a licensed electrician should connect power to panel and system.

6. Never expose heater tubes to air with power on. DANGER OF EXPLOSION MAY EXIST.

7. Care should be used when working around tubes when cleaning or installing. Walls are only 1/4" thick.

8. If there are any questions concerning the ratings or instructions please contact your distributor or the factory. Phone (206) 682-3414  Fax (206) 682-1582
1. These instructions cannot possibly cover every situation concerning the operation, inspection adjustment and test of the equipment furnished. Process Heating Company (PHCo), in the furnishing of this equipment and these instructions, must presume that the operating and maintenance personnel using this equipment have sufficient technical knowledge and experience to apply sound safety and operational practices which may not be mentioned.

2. In applications where PHCo furnished equipment is to be integrated with a process or other equipment, these instructions should be thoroughly reviewed to determine the proper integration of the equipment into the overall plant or system operational procedures.

3. PHCo does not supply, recommend, or approve the various systems in which its products are or may be used. Unless designed, manufactured, and used properly, various systems may be inherently unsafe or dangerous. The user should check and comply with all federal, state and local regulations and other regulations and recommendations such as: NFPA, UL, API, OSHA, etc.

UNITIZED HEATER KIT-INSTALLATION & OPERATION

Preparation

1. Remove jacketing and insulation from section of tank heater is to be installed through.

2. Mark location of opening of tank. Heater should be kept as low as possible in tank.

CAUTION!
BEFORE BURNING OR WELDING ON TANK CLEAN THOROUGHLY AND KEEP WELL VENTILATED

Installation

1. Burn opening in tank slightly larger than heater terminal box (snug fit). Remove slag and grind opening smooth.

2. Remove blocking and slide heater through opening in tank. Stop at marked "weld line" on heater terminal box.

3. Heater tube support plates should be attached to tank bottom. Level heater tubes and weld supports to tank. DO NOT weld heater tubes to support plates.

4. Weld heater terminal box to tank. Terminal box is 1/4" thick steel plate. Weld must be liquid tight.

5. Tank discharge should be kept 2" to 3" above heater tubes. Never expose heater tubes to air with power on. DANGER OF EXPLOSION MAY EXIST.

6. Re-install insulation and jacketing around heater terminal box.

7. Have licensed electrician connect proper voltage and phase with properly sized conductors to main power switch. Unit must be adequately grounded. Check all electrical connection for tightness.
Operation

1. Fill tank with desired material. Turn on power at main switch.

2. Set main indicating temperature control to proper tank holding temperature.

3. Set Hi-Limit control 20 to 30 degrees above main control set point. Hi-Limit will act only in event of main control failure. Heater will continue to cycle at Hi-Limit set point and red light on panel door will indicate "Hi-Limit" condition. Press light to reset when condition is remedied.

4. If unit is equipped with a time clock, see instruction sheet for proper clock setting.

5. Heater operation is now completely automatic. Check electrical connections periodically for tightness. Keep panel door closed tightly at all times.

6. Clean tank at regular intervals. Heater tubes are 1/4" thick steel pipe. Use care with jack hammers and chisels so as not to rupture tube wall.

*****Note*****
Terminal block if provided is to inter-lock heat "off" while other loads are running. (Remove jumper and connect to terminals #1 & #2.)

CONTROL PANEL

ALL WIRING SHOULD CONFORM TO REQUIREMENTS OF APPLICABLE NATIONAL AND LOCAL ELECTRICAL CODES AND STANDARDS.

Rating and voltage of the unit will be found on the name plate located on the inside of door in the control panel, and conduit enclosed insulated conductors of the proper gauge should be brought from the main circuit breaker or fused disconnect switch.

The controlling thermostat can be pre-set to any desired temperature within the thermostat dial range.

If the control panel has been equipped with a time clock please refer to the separate instructions enclosed for proper clock setting.

Your unit has also been equipped with an over-temperature thermostat that should be set 20 - 30 degrees above main temperature control. Its primary function is to protect against over heating in the event of main temperature control malfunction. The unit will cycle at this new temperature and a red Hi-Limit warning light, on the outside of the control panel will light. This light will remain on until the limit circuit is reset to alert personnel that there is a malfunction.

The cause of the malfunction should be investigated at once. Possible reasons are:

1. Capillary rupture on the main temperature controller (indicated by temperature indicating pointer at far left hand position).

2. "Over Ranging" of the main temperature controller (indicated by incorrect temperature reading on the scale).

3. Thermostat temperature setting is too high.

4. Main temperature controller out of calibration.

5. Over-Temperature thermostat out of calibration.

6. Heater magnetic contactor locked in closed position because of "welded" contacts or mechanical bind.
For Utilized Heaters

Maintenance checklist

1. Check electrical connections for tightness.

2. Tank should be cleaned at regular intervals.

3. Check to be sure the control panel door is tightly closed at all times.

4. Be sure to see that tank has adequate insulation. Insulation tends to break down in time thus costing dollars in lost efficiency.
List of part #s used on the 28kW 240V 3Ph heat kit:

Our Model # for this heater kit is U-2892724-2-3

PROCESS HEATING COMPANY
Appendix IV

Process Heating Co. Warranty
Five Year Warranty

on
Products
Manufactured by
Process Heating Company
PHCo

and delivered to the initial user are subject to the following limited warranty:
PHCo warrants its Patented Heating Elements to be free from defects in workmanship and materials for a period of five (5) years (one [1] year for drop-in-style) after the date of delivery to the initial user when operated under normal use and service and in accordance with printed instructions provided by PHCo. All other parts and components provided by PHCo as part of the unit are warranted to be free from defects in material and workmanship for a period of one (1) year from date of delivery to the initial user.

THE ABOVE WARRANTY IS SUBJECT TO THE TERMS AND CONDITIONS ON THE REVERSE SIDE OF THIS DOCUMENT.
Unless otherwise agreed in writing by Process Heating Company ("PHCo"), all of the following terms and conditions shall apply to its transaction with you (the "buyer"):  

1. **LIMITED WARRANTY; DISCLAIMERS.** PHCo warrants that the goods sold under this contract shall be free from defects in workmanship and material at the time delivery is tendered. If there is discovered any failure of goods to conform to this limited warranty within one (1) year after tender of delivery (five (5) years in the case of immersion type heating elements other than drop-in style elements), and if Buyer notifies PHCo in writing of such fact within thirty (30) days following such discovery, PHCo at its own expense either will repair the defective item, or replace it, or refund to Buyer the purchase price paid for that item (with the choice between repair, replacement or refund to be made solely by PHCo). The foregoing limited warranty and remedy are exclusive of all other warranties, express or implied, and constitute PHCo's exclusive liability, and Buyer's exclusive remedy, on account of any claim relating to any item sold. PHCo DISCLAIMS ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE. If PHCo should elect to repair or replace a defective item and if for any reason the repair of replacement should fail in its essential purpose (which is to provide Buyer with a non-defective item), then PHCo's liability nevertheless shall be limited to the purchase price charged by PHCo for the goods. PHCo shall have no liability on account of any claim asserted under principles of negligence or other tort, breach of any statutory duty, indemnity or contribution, or on any other basis, if PHCo's liability on account of such claim would exceed or in any respect differ from its liability under the foregoing limited warranty and exclusive remedy.  

2. **LIABILITY OF PHCo UNDER THE FOREGOING LIMITED WARRANTY SHALL EXIST ONLY IF:**  
   a. The goods are installed, operated and tested in accordance with the PHCo approved installation and operating instructions.  
   b. The goods are used and maintained in conformity with installation and operation instructions approved or published by PHCo.  
   c. Written authorization must be given by PHCo before any warranty work is done.  
   The above limited warranty shall be void and no further in effect if the goods are subject to abuse, strain, impact or loading that is greater than their normal  

3. **LIMITATION OF LIABILITY. UNDER NO CIRCUMSTANCES SHALL PHCo OR ANYONE ELSE INVOLVED IN THE MANUFACTURE OR SALE OF THE GOODS BE LIABLE TO BUYER OR OTHERS FOR ANY SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES, INCLUDING BUT NOT LIMITED TO LOST PROFITS, EVEN IF PHCo HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES, OR FOR ANY DAMAGES OR SUMS PAID BY BUYER OR OTHER TO THIRD PARTIES. THE FOREGOING LIMITATION OF LIABILITY SHALL APPLY WHETHER ANY CLAIM FOR ANY SUCH DAMAGES IS BASED UPON PRINCIPLES OF CONTRACT, WARRANTY, NEGLIGENCE OR OTHER TORT, BREACH OF ANY STATUTORY DUTY, PRINCIPLES OF INDEMNITY OR CONTRIBUTION, THE FAILURE OF ANY LIMITED OR EXCLUSIVE REMEDY TO ACHIEVE ITS ESSENTIAL PURPOSE, OR ANY OTHER BASIS.**  

4. **AUTHORITY OF PHCo'S AGENTS.** No agent, employee or representative of PHCo has any authority to bind PHCo to any other affirmation, representation, promise or warranty concerning the goods sold under this contract, unless it is in writing and included as part of the terms of this a contract.  

5. **MODIFICATION OF WAIVER.** No subsequent waiver or modification of this Limited Warranty and Liability shall be effective unless the same is in writing and signed by the party against whom such waiver or modification is asserted. No waiver in any one instance shall constitute a waiver of the same or any other term or condition on any subsequent occasion. None of the express terms of this Limited Warranty and Liability may be waived or varied by course of dealing or usage of trade.  

6. **DISPUTES.** This agreement shall be governed by the laws of the State of Washington without reference to its choice of law rules. Any action to enforce any of the terms or conditions of this agreement may be commenced or maintained at the option of either party in any federal or state court located in King County, Washington having jurisdiction over the matter, and both parties consent in advance to the exercise by such courts of jurisdiction over them personally. No action by either party arising out of or relating to this contract (including any action based upon principles of contract, tort or otherwise) may be commenced more than one (1) year after the cause of action has accrued, and any action commenced by a party thereafter shall be dismissed at the instance of the other party.
Appendix V

Control Panel Wiring Schematic
SINGLE SWITCH
INDICATING MECHANICAL
TEMPERATURE CONTROLLER

This single switch indicating temperature controller operates fuel valves or relays which start and stop heating or cooling systems in a wide variety of applications. It is the smallest and most compact of the indicating mechanical instruments. It derives its simplicity and efficiency from the Piston-Pak filled systems sensing element.
MF79 PRODUCT SPECIFICATIONS

Dimensions 6 3/4" W X 6 5/16" H X 4" D.
Wall Mounting Brackets supplied with instrument.
Panel Mount Cutout 5 1/4 inches wide X 5 15/16 inches high.
Switch Type Three wire single pole double throw.
Switch Sensitivities Normal 1% of range (Factory standard #79 Switch).
Super Sensitive 1/2% of element range (Optional #73 Switch).
Electrical Hookup Terminal block accessible through top cover hatch.
Conduit Openings One 7/8 inch diameter hole on each side of the case for 1/2 inch conduit fitting; drill guide hole spotted in the rear of the case showing operational rear opening locations.
Electrical Rating 50VA, inductive; 500VA, non inductive; 250V maximum AC only.
Agency Approvals Underwriters Laboratories and Canadian Standards
Approx. Net Weight* 5 lbs
Approx. Ship. Weight* 8 lbs

* Weight may vary depending on element length.

MF79 ORDER MATRIX

<table>
<thead>
<tr>

</thead>
</table>

MF79* (Requires L-Type element plunger).

ACCESSORIES

1 None
2 237A Weather Resistant**
3 266 Fungus Proofing

* The standard switch on an MF79 is a #79 and offers an accuracy of 1% of span. Accuracy of 0.5% of span may be achieved by specifying a #73 Switch. However, a #73 Switch must be ordered individually and will be shipped separate. User must remove the factory standard #79 switch and install the #73 Switch. (See SWITCH REPLACEMENT section in this document, page 4). To order the #73 Switch specify part #54403018.

** Requires an inverted dial scale. Check with factory on availability.

PISTON-PAK THERMAL SENSING ELEMENT

A Piston-Pak Thermal Sensing Element must be specified for each MF79. Use Partlow Form Number 3025 "Mechanical Products Cross Reference and Pricing Guide" to configure the matrix number for the sensing element.
INSTALLATION AND WIRING

LOCATION
The element head assembly is subject to ambient temperature limitations of -30°F to 125°F (-35°C to 52°C) for low temperature head assemblies, and 32°F to 150°F (0°C to 66°C) for high temperature head assemblies. These temperature limitations must be considered when determining the instrument location. It should be located in an area as free from vibration as possible.

MOUNTING
The instrument(s) may be surface or flush mounted. For flush mounting proceed as follows: Cut the panel opening to the sizes illustrated in Figure 1 (at right). Then drill 7/32 inch clearance holes where indicated in Figure 1 and if desired, tap for #10 flat head screws.

WIRING
The conduit hole should be used to make all electrical connections through. Make necessary electrical connections using short sections of flexible cable or conduit according to applicable electrical codes, ordinances and regulations regarding the use of conduit, etc. Next, access the connection terminal block by unscrewing the two screws on the top and removing the top cover hatch. The terminal block is labeled H, C and L (See Figure 2, below). H represents normally-open, C common and L normally-closed. Make your necessary electrical connections using Figure 2 as a guide.

PLACING THE THERMAL SENSING ELEMENT
Locate the thermal sensing bulb in the most agitated part of the medium to be measured and completely immerse it. (When U and Y-type bulbs are used note separation coupling between bulb and capillary.) Be sure to immerse the element up to the coupling for correct temperature indication. Do not bend capillary to less than 1/2 inch radius and never bend it too close to the element bulb or element head. Pencil type bulbs must never be bent as this will affect instrument accuracy. U and Y-type bulbs may be bent, but never to less than a two inch radius. Anchor the excess capillary securely to prevent vibration damage. These bulbs may be elevated up to 40 feet above the instrument without affecting calibration. For elevations over 40 feet consult your local Partlow Representative, Distributor or the Factory.

STUFFING BOX INSTALLATION (IF APPLICABLE)
Overtightening of 21-T-105 steel or stainless steel stuffing boxes can damage the thermal element by restricting the capillary bore. To prevent damage, the stuffing box gland nut should be turned 1/2 to 3/4 of a revolution from a finger-tight position. This is equivalent to a torque of 65 to 100 inch-pounds for steel and 130 to 180 inch-pounds for stainless steel.

INSTRUMENT OPERATION
Prior to putting the instrument into service check it against an accurate test thermometer. As with any precision instrument minor adjustments may be necessary after shipment and installation. If you are unfamiliar with how to perform this check refer to the CHECKING TEMPERATURE and RE-ZEROING section of this document.

Control temperature is established by turning the knob on the front cover. The knob moves the red set pointer along the scale to the desired setting. This positions a single snap-acting switch in at the control point. The black indicating pointer moves up or downscale in response to the Piston-Rax thermal sensing element. When the indicating pointer moves in line with the red setpointer the snap-acting switch is actuated and opens or closes the circuit controlling the heating or cooling input to the application.
MAINTAINING YOUR MF79

CHECKING TEMPERATURE
When checking and verifying your temperature be sure to use a test thermometer of accuracy. Position the test thermometer sensing bulb or probe adjacent to the thermal sensing bulb from the MF79. Turn the red set pointer on the MF79 to the desired process temperature or above. Wait for the temperature to stabilize, then compare the test thermometer reading with that of the MF79 (Black indicating pointer). If the two readings do not agree, the MF79 should be re-zeroed.

RE-ZEROING YOUR MF79
Be sure that the process temperature is stable. Move the red set pointer to the temperature indicated by the test thermometer. Remove the setting knob on the instrument cover. See exploded view illustration, page 6. Loosen the set screw S (Figure 3, below) and using the 3/16 inch wrench provided with the MF79 turn shaft J until the black indicating pointer reading matches the test thermometer reading. Tighten the set screw S. Check the adjustment by allowing the temperature to stabilize and compare the readings. Repeat these steps if necessary.

SWITCH REPLACEMENT & #73 SWITCH INSTALLATION
Turn the power to the MF79 off. Remove the setting knob and cover (See exploded view illustration, page 6) and remove the two screws holding the switch to the switch arm. Take out the existing switch and remove the wires. Re-connect the wires to the replacement switch one wire at a time to avoid confusion. (When installing a #73 switch re-connect the wires to the same respective terminals as on the #79 switch). Then re-assemble the switch in the mechanism, replace the MF79 front cover and knob. Then turn on the power. Note: After replacing the switch it may be necessary to make an adjustment to the switch actuator screw E (Figure 4, below). If, during normal process temperature cycling, the black indicating pointer registers a constant differential over or under the red set pointer adjust the actuation screw E to correct. Lengthening the screw lowers the temperature while shortening it raises the temperature.

BRAKE TIGHTENING
Periodically the setting shaft brake may require tightening. If the brake is too loose, the overtravel movement of the black indicating pointer will tend to drag the red set pointer upscale from its set position. To tighten the brake, turn the adjustment screw U clockwise (Figure 5, below). Do not overtighten.
Figure 8 - Dimensional Drawing

Figure 9 - Mechanism Drawing

Left Side View

Front View
PISTON-PAK THERMAL SENSING ELEMENT IDENTIFICATION

An element designation number is stamped on the bottom of the element head. This is a
coded description of the element specifications and should be used whenever a replacement
element is ordered. The number appearing on the side of the element head (Figure 6, below)
is the element age code, which may be required in establishing warranty.

ORDERING/SPECIFYING THE PISTON-PAK SENSING ELEMENT

The sensing element is ordered separately from the MF79 and requires its own matrix
number. To determine the correct sensing element configuration for your instrument(s) and
application see Partlow Form 3028 “Mechanical Products Cross Reference and Pricing
Guide.”

ELEMENT REPLACEMENT

To change a thermal sensing element start by removing screws D (Figure 7, below) and
withdrawing the element from the instrument body. Then remove the element bulb
from the medium. Install the new element and replace screws D. Insert the new
element bulb into the medium being measured.

Note: After the element has been replaced, check the temperature setting, re-zeroing
may be necessary. If so, see the CHECKING TEMPERATURE section.

Caution: The inside mechanism(s), particularly the inside of the element
housing, should never be oiled. However, if the instrument is subject to
corrosion or gunking conditions, the mechanical linkage should be sprayed
periodically with corrosion inhibiting CRC 2-26, 3-36, or 5-56. Use only CRC
2-26, 3-36, or 5-56 as other lubricants may cause build up and sticking of
internal parts. CRC 2-26 may be purchased from Partlow in a 15 oz. con-
tainer (part #63600401). CRC 5-56 may be purchased locally from any
hardware or automotive store.

Warranty

These products are sold by The Parnow Corporation ('Parnow') under the warranties set forth in the following paragraphs. Such warranties are extended only with respect to a purchase of these products at retail and are extended to the first buyer hereof who purchases such products other than for the purpose of resale.

These products are warranted to be free from functional defects in materials and workmanship at the time of sale of the products leave the Parnow factory and to conform in all material respects to the specifications set forth in the retail Parnow Instrumentation manual. Should a product fail to conform to the above warranties, such products are warranted free of charge. In the event of any claims against the manufacturer for the products which are warranted herein, all claims of any kind, including any claims arising under warranty or otherwise, shall be directed to Parnow at its main office at 2 Campson Road, New Harmony, New York 13491 or FAX MAIL: 315-751-0423, and which if so advised by Parnow, are returned with a statement of the observed deficiency to the designated facility during normal business hours. In the event a product is repaired, such products are warranted free of charge. The above warranties shall not apply to any product which has been abused, misused, improperly installed, or altered. Any such product shall be at the sole expense of the customer. The above warranties are extended to the first buyer hereof who purchases such products other than for the purpose of resale.

Parnow shall not be liable for any incidental, consequential, or other damages or expenses, excepting only the cost or expense of repair or replacement as above described. There are no express or implied warranties, oral or written, beyond the warranties herein above set forth. Parnow makes no warranty of merchantability or fitness for a particular purpose with respect to the products.
